

# Evaluating Functions - Pre-5

Topic: Evaluating Functions

Date:

Objectives: SWBAT (Evaluate Given Function at Given Value)

Main Ideas:	Assignment:					
<b>Function Notation</b>	<p>The common notation of a function is usually written as,</p> $f(x) - \text{this does not mean the multiplication of } f \text{ and } x$ <p>It is read as</p> <p style="text-align: center;"><math>f</math> is a function of <math>x</math></p> <p style="text-align: center;">or</p> <p style="text-align: center;"><math>f</math> is some expression involving the variable <math>x</math></p> <p>Functions can also be written in different ways using other variables such as: <math>g(x), h(x), \text{ and } k(x)</math></p> <p>In addition, functions may take other input values other than <math>x</math>. <math>f(a), h(r), \text{ and } k(m)</math></p>					
<b>Main Focus</b>	<p>The key idea is always remember that the variable <b>outside</b> the parenthesis is the “<b>name</b>” of the function (also known as the <b>output value</b>), while the variable <b>inside</b> the parenthesis is the <b>input value</b> of the function.</p> <div style="text-align: center;"> <p><i>Function k</i> → <math>k(m) = m^2 + m - 8</math></p> <p style="margin-left: 100px;">↑</p> <p><i>Input value or in terms of m</i></p> <p style="margin-left: 150px;">Output value</p> </div>					
<b>Evaluating Functions</b>	<p>To evaluate a function is to: <b>REPLACE</b> (substitute) the defined variable with the given number or expression. Examples:</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td data-bbox="264 1230 914 1591"> <p>Given: <math>h(t) =  t - 2  + 3</math>; find <math>h(6)</math></p> </td> <td data-bbox="914 1230 1562 1591"> <p>Given: <math>g(a) = 3^{3a-2}</math>; find <math>g(1)</math></p> </td> </tr> <tr> <td data-bbox="264 1591 914 1957"> <p>Given: <math>k(m) = m^3 - 5m^2</math>; find <math>k(-4)</math></p> </td> <td data-bbox="914 1591 1562 1957"> <p>Given: <math>f(n) = n^2 - 2n</math>; find <math>f(n^2)</math></p> </td> </tr> </table>		<p>Given: <math>h(t) =  t - 2  + 3</math>; find <math>h(6)</math></p>	<p>Given: <math>g(a) = 3^{3a-2}</math>; find <math>g(1)</math></p>	<p>Given: <math>k(m) = m^3 - 5m^2</math>; find <math>k(-4)</math></p>	<p>Given: <math>f(n) = n^2 - 2n</math>; find <math>f(n^2)</math></p>
<p>Given: <math>h(t) =  t - 2  + 3</math>; find <math>h(6)</math></p>	<p>Given: <math>g(a) = 3^{3a-2}</math>; find <math>g(1)</math></p>					
<p>Given: <math>k(m) = m^3 - 5m^2</math>; find <math>k(-4)</math></p>	<p>Given: <math>f(n) = n^2 - 2n</math>; find <math>f(n^2)</math></p>					

<b>Your Turn</b>	Given: $h(t) = -2 \cdot 5^{-t-1}$ ; find $h(-2)$	Given: $f(x) = x^2 - 3x$ ; find $f(-8)$
	Given: $k(a) = -4^{3a+2}$ ; find $k(a - 2)$	Given: $p(a) = a^3 - 5$ ; find $p(x - 4)$
<b>Function Value</b>	Given: $f(x) = 3x - 7$ ; find $x$ when $f(x) = -8$	Given: $h(t) = x^2 - 15$ ; find $t$ when $h(t) = 21$
<b>Graphs</b>	<p>Look at the graph below</p>  <p>In the graph above <math>f(4) = 1</math>.</p> <p>Find the following values of the function.</p> <p><math>f(6) =</math>                      <math>f(2) =</math></p> <p><math>f(0) =</math>                      <math>f(5) =</math></p> <p>For which values of <math>x</math> is this statement true?  <math>f(x) = 1</math></p>
